

GLIDE-LINE™

DART – Drop and Rotate Transfer..... *DART*

DART is a revolutionary innovation for pallet and work piece handling designed to simplify layouts and reduce cost.

This specialized hub has been specifically designed to maximize layouts and save complexity and cost. The DART system is a powered conveyor that can rotate from 1 degree to 360 degrees to accomplish almost any angle transfer in a system, including conventional right angle transfers. The pallet can either rotate with it (changing orientation) or stay static (maintaining orientation). With this new design in your overall layout design toolbox, Glide-Line's DART will allow for endless opportunities and maximize assembly workspace.

Glide-Line Delivers

www.glide-line.com

DART Features:

- Servo driven rotation for smooth rapid and precise positioning
- The device does not violate the space between the conveyor strands so all of the standard conveyor mounted stops and accessories can be used
- Static center plate available to maintain work piece orientation when making right angle transfers
- Smooth pneumatic vertical motion with integrated adjustable air cushions

DART Benefits:

- Used as a centralized hub, DART can help solve complex pallet and work piece distribution challenges
- Is capable of operating with more than two stands of conveyor, ideal for handling heavier pallets and large panels
- Develop higher level automated systems at a lower relative cost
- Dart utilizes many of our standard conveyor and device parts

DART Savings:

- By managing complex traffic control conditions, DART makes it possible to minimize the size of your overall system
- Simplifies pallet handing by utilizing standard conveyor mounted pallet stops and accessories
- More cost effective than using typical lift transfers units
- Use the DART to rotate and transfer in a single station
- Much less complicated than alternative systems

Glide-Line™ – We promise you will meet your project's tightest deadlines; we promise you will be impressed.
